

Web Applications – Exam #2 (deadline 2027-07-07 at 23:59)

“Sandwich”

Question and answers already given in the google doc

1. when choosing the optional ingredients, the user can select add the same ingredient multiple times or you can select only one portion for that ingredient? what about the dressings?

only one portion for the ingredient, only one portion for the dressings.

2. in the description of the sizes, the number of included ingredients refers only to optional ingredients, or it is also including the main ingredient in the count?

The number of included ingredients refer to the ones which are included in the price. Ingredients are all optional.

Clarification: the "main ingredient" is not included in the total number of ingredients. So "small sandwich" means e.g., meat + (optional)lettuce + (optional)olives. This will be better clarified in the final version of the text.

3. Since the text refers to "optional ingredients", should users be allowed to select fewer ingredients than the number included in the base price? For example, can a Large sandwich have only 2 optional ingredients, or must it have at least 4?

Yes, it can have less ingredients, e.g., 2.

4. I would like to ask a clarification regarding the requirement 'there is no need for handling dates' combined with the daily limits for sandwiches (10 S, 8 M, 6 L). I interpreted it as: the entire database should be treated as representing a single on going day, so availability is computed as the daily maximum minus all sandwiches currently in confirmed orders, without implementing any logic to reset the counters over time (at midnight or on a new day). Is this correct?

Correct.

5. Since it says that all users can cancel orders, should we assume that the database only contains users with the associated secret, or should we also

consider users who do not have the secret and therefore cannot perform 2FA at all?

All users have the possibility to cancel orders, therefore all users must be able to perform 2FA.
