

Web Applications – Exam #1 (deadline 2026-06-18 at 23:59)

“Theater”

Question and answers already given in the google doc

1. Should we do a Sign Up Page or we just stick to the login ?

Not required

2. Is it wrong implementing it for more theaters? (and for more shows?)

Not required. Any mistakes there can affect the final grade.

3. This requirement seems to be in conflict with the one specified in the "Database requirements" section which says "at least 4 rows". Which one is correct?

What is the problem? 4 rows of length 25, 26, 27, 28, for instance, satisfy all requirements.

4. Can a reservation include seats from different categories? (For example, reservation r1 includes seat A1-premium and seat D1-normal)

Yes except for where otherwise noted.

5. it is required or optional?

"Yes" means required.

6. Regarding reservations, normally a reservation is binded to a specific date and hour , should we take into account this mechanism or we omit timing at all ?

Up to you, but you need to comply with all the rest of the specifications.

7. professor, if a user order more seats than the size of a row? is always denied the request? like if we have a theater with 10 seat per line and user ask 12 and even the extra aligned seats don't arrive at 12 positions?

Why should it be denied? it says "otherwise, any seat assignment is acceptable".

8. Can an Admin with 2FA enabled edit his own reservations (previously booked by the admin himself but logged in as a normal user)?

Not required.

9. professor, admin have to see name and email of other users? and then modify their reservation(what can modify)? or admin can see just random reservation without knowing owners? than they can completely delete a reservation involving removing all the seats? and they can add only inside a user reservation, once selected, seats(but can not create completely new reservation)?

There is no specification about name and email. They are just normal user that can also act as admin as specified in the text, deciding it at login time. If they act as normal users they can do what other normal users do. If admin, they can act on other users' reservations. They cannot add reservations on behalf of other users (neither on their own).

10. So if an admin logs in as admin he cannot book reservations for himself?

It is not required.

11. So basically the admin can edit the (existing) reservation of another user by adding seats or deleting seats of the reservation currently editing. But cannot add it from scratch on behalf of another user.

Correct.

12. Regarding the login for normal users, for example if we have a checkbox to allow the choice of being admin or not for normal users should they receive an error message or just login normally into the app(in non admin).

The implementation must be decided by you and it is subject to evaluation. Adopt reasonable choices, if you were somebody that is just using the application without any particular instruction.

13. wheather a normal user modified his/her own reservation(e.g deleting a seat), an admin can add to that reservation the seat just deleted or admin has to wait 40 seconds?

Up to you, just use the easier-to-implement solution.

14. is it required the API.http file in the directory?

Not required

15. is it possible to create custom css rules (along with react components) in order to make the UI more responsive or better looking in general?

Yes, as long as you are able to explain them in details. Remember that no additional points will be given for responsive or "better looking" UI.

16. Does the login procedure must support both username and/or email or we can choose a single mechanism?

Not required.
